TMF Trade Setup...

Posted on [January 6, 2016, 2:56 pm](#) by [Rambus](#)

Below is a combo chart which has the TIP:TLT ratio chart on top overlaid with the TLT in red and the CRB and GDX charts on the bottom. The TIP:TLT ratio chart shows when the ratio in black is falling it signals a deflationary environment and when it's rising an inflationary environment. This weekly chart goes back to the beginning of the deflationary period that began for most commodities back in 2011. For the better part of 2015 the ratio and TLT have been consolidating with the TLT forming a bull flag while the TIP:TLT ratio in black formed a bear flag. The break out and backtesting of their respective blue patterns was a little laborious but that looks like it maybe coming to an end which would suggest another round of deflation maybe just around the corner. The CRB index and the GDX have followed this deflationary wave down for the most part.

Below is a weekly chart for TLT which shows the blue bull flag that found support on top of the brown shaded Support & Resistance zone. Looking back at the 2011 low you can see there have been two impulse moves higher with the third one possibly just getting started.

Based on the charts above I'm going to take initial position and buy 200 shares at the market at 78.05 with the sell/stop just below the right shoulder low at 69.10. TLT is a 1 X long etf. The more conservative members will want to wait until the neckline is broken to the upside before you take a position.
